Title of the presentation - New and existing offshore infrastructures: key resources for the energy transition. Assorisorse and Elettricità Futura

Description of the presentation/Summary - The alternative use and conversion of existing infrastructures at sea, such as oil&gas platforms, can contribute to the reduction of energy production costs and foster the development of new technologies.

It is necessary to create a shared knowledge about the nature of offshore projects, the technologies available on the market, identify the financial tools to develop the projects and have a clear "outlook" on the projects that can be built in Italy and abroad in the next decade.

With this meeting, Assorisorse and Elettricità Futura want to identify ideas and proposals for the legislator. The skills acquired by the supply chain in the offshore energy sector need to be shared in order to integrate technologies and regulations - including wind offshore - in a perspective of Energy Transition.
