Type Approval of valves and actuators for hydrogen application

National and international decarbonization strategies identify hydrogen as a key energy vector, especially in highly energy-intensive sectors that are difficult to electrify as Oil & Gas. To convert existing plants or to build new H2 piping and pipeline, product conformity, applied to the sector of valves and hydrogen-operated actuators, is a key factor for compliance with the quality and safety standards.

During the meeting, the Bureau Veritas H2 Type Approval procedure will be illustrated.
